

V. EXISTING CONDITIONS

Wood Rodgers did not make modifications for the NVSSP area to redefine Existing Conditions modeling or floodplain mapping in the current DMP. The existing floodplain, as defined in the current DMP, is presented on Figure 7. Figure 7 also shows topographic mapping, approximate wetland delineations, and the approximate FEMA floodplain. With respect to the FEMA floodplain, supporting documentation was requested from FEMA to substantiate the basis for the FEMA floodplain. Until this information is provided and evaluated, the actual reasons for the differences between the two floodplains cannot be ascertained, although differences in the detail topographic mapping available for the respective analyses are thought to be a significant factor.
